

1. Install git

Download the installer from this link and install git:

<https://git-scm.com/downloads/win>

2. Restart your computer

3. Open git bash

4. Type “ls -al ~/.ssh”

5. If you get “command not found”:

- a. Type the following command: `ssh-keygen -t ed25519 -C “your_email@mail.com”`

- b. Type “Enter” 3 times

- c. Now, when typing “ls -al ~/.ssh” you should see two files, “id_ed25519” and “id_ed25519.pub”

6. Type “cat ~/.ssh/{filename}.pub”. Note that if you already had a file there, maybe it has an other name. You need to show the content of the file with “.pub” extension.

7. Copy the shown line into the clipboard. It should be something like this:

```
ssh-ed25519 AAAAC3NzaC1lZDI1NTE5AAAAIAsgGJBfOeRNRs6LF2OL/fSyWA54YWqNAv1hVTed6tf9
your_email@gmail.com
```

8. Go to github.com

9. Follow the instructions of this website so you can add the newly generated ssh key:
<https://docs.github.com/en/authentication/connecting-to-github-with-ssh/adding-a-new-ssh-key-to-your-github-account>

10. Now, you can get back to your git bash and execute the git clone instruction (or git init, or whatever we’ll see in the course).

The use of `git bash` is then recommended to execute the git statements since it simulates a bash environment equivalent to the one shown in the videoconferences.
